

A deep space field of stars and galaxies, serving as a background for the text. The field is filled with numerous stars of various colors (white, yellow, orange, red, blue) and several galaxies, including a prominent spiral galaxy in the lower center. The overall appearance is that of a rich, multi-wavelength astronomical survey.

The Shakhbazian Compact Galaxy Groups Catalogue and Observing Project

In 1957, Romela Shakhbazian examined a Palomar Sky Atlas plate and noticed a tight group of red objects. She examined more plates and found 16 more such groups and all were about 1' in diameter, so she wrote a journal article on it.¹ It was believed at that time it was a small tight cluster of red stars. It wasn't until 15 years later in 1972, when Robinson and Wampler took a closer look and the spectra of five objects in the first listed group that Shakhbazian looked at and realized that they were not red stars, but galaxies.² They named it Shakhbazian 1 to represent a new system of galaxies called compact clusters of compact galaxies.

In 1973, several others took a new systematical search to look for more compact clusters of compact galaxies on the Palomar Sky Survey. The following criterion must be met to be considered for the new system of galaxies:

1. Consists of 5 to 15 members.
2. Each galaxy's apparent magnitude is between 14th to 19th magnitude.
3. Compact group. Relative distances of member galaxies should be 3/5 of the diameter of a galaxy.
4. Almost all must be extremely red. No more than two blue galaxies.
5. Galaxies must be compact, high surface brightness, and not diffuse.
6. The group must be isolated.

It turns out that one of the richest groups is the first one, Shakhbazian 1. The spectra of the five objects in Shakhbazian 1 calculated the distance to be about 2 billion light years distant with a diameter of 620,000 light years across and the average diameter of individual galaxies is just 40,000 light years across.³ In comparison, the Milky Way and Andromeda Galaxy are about 100,000 and 130,000 light years across respectively, and 2.2 million light years from each other. That would make Shakhbazian a compact group of high-luminosity galaxies close to each other. The velocity dispersion is very low, suggesting that they are together in one compact group. It was also found that the absolute magnitude of the brightest member of Shakhbazian 1 is -23.0, which means that it is one of the brightest known galaxies. Imagine what that would look like for the deep sky observer from one of the member galaxies! 5+ high luminosity galaxies crammed into a "small" 620,000 light year space.

Then in 1975 Mirzoyan, Miller, and Osterbeck took a closer look at Shakhbazian 123 and determined that it has similar characteristics to Shakhbazian 1.⁴ They thought they were onto something. Further research on other Shakhbazian groups showed that the pattern of small velocity dispersion properties was indeterminate.

After research from 1972 to 1979, it was demonstrated that most Shakhbazian groups are in one of the following types of groups:

1. Spherical concentrated groups
2. Chains
3. Peripheric groups

Later observations of these groups with high angular resolution revealed that member galaxies are mostly of E and S0 types, which are high surface brightness galaxies. This can be helpful for visual observers as it is detectable even at 2 billion light years distant. Also, it has now been shown that the group members are not

³ Tiersch, H. Compact Groups of Compact Galaxies. *Astronomische Nachrichten*. (Vol 297, Iss 6, 1976), 301

⁴ Tiersch, H. Compact Groups of Compact Galaxies, 301

particularly compact, so the more recent journal articles now call them Shakhbazian Compact Galaxy Groups (Shk).

By 1979, the catalogue grew to 377 and was compiled by Shakhbazian, Petrosian, Baier, and Tiersch. They produced 10 journal articles, see Additional Resources on page 139 for bibliographic details. The unfortunate thing is that the coordinates of the groups in the original journal articles given were relatively low accuracy, so more than a few of the Shk groups were difficult to discern in galaxy-rich fields. The good news, almost 20 years later, D. Stoll and team put out 10 papers on the photometry and the identification of each member of the groups.⁵ I have used his papers to center and mark the members in this guide. It also turns out that because of the quality of the Palomar plates, some members are faint red stars, not galaxies. So, in this observing guide, I edited the number of “members” based on Stoll’s papers whether they are galaxies or stars, and corrected the coordinates to the approximate center of the Shk Groups. Some were as far as 5’ off, which makes identification difficult without Stoll’s papers. I’m grateful for his work. I’ve used the Sloan Digital Sky Survey (SDSS) where available to mark galaxies or stars, where available. When Stoll did his work, SDSS was not available at the time.

Two decades after Stoll, et al work, more and improved data and improved sky survey imagery were made available, thus researchers, such as H.M. Tovmassian, did more research on the Shakhbazian groups and determined that a percentage of the original 377 groups were “false” groups.⁶ They were mostly stars or galaxies with redshifts differing from each other. Differing redshifts mean that the galaxies are different distances from us and, therefore not associated with each other. And there was a small percentage that was part of a larger cluster of galaxies. In my guide, I’ve left out the “false” groups and left in the Shk groups that are part of a larger galaxy cluster.

For this observing guide, I have included 122 of 377 Shakhbazian groups to give a sampling of what is observable with large amateur telescopes. This list is not for the faint of heart but presents an extreme challenge even for those with a 30” reflector or those with electronically assisted astronomy equipment.

Shakhbazian Groups Catalogue is a very challenging visual observing program. Here are some observing tips that will hopefully improve your chances of seeing them:

- A steady sky is key for resolving individual members.
- Take great care when looking. Stars appear brighter in the eyepiece than the stars on the DSS and SDSS images and have given false positives. Examine the provided annotated images and note the locations of the foreground stars.
- Keep your eyes dark adapted as fully as possible. Even the sky glow from the sky, especially if the Milky Way is above the horizon, can impact your night vision. When not looking at the eyepiece, waiting for your turn at the eyepiece, or just taking a break, look down at the dark ground, preferably with a hood over your head. I sometimes look down for a few minutes before looking in the eyepiece.

⁵ The first of the ten journal articles is D. Stoll, H. Tiersch, H. Oleak, and F. Baier. Photometric catalogue of Shakhbazian Compact Groups of Galaxies. I. *Astronomische Nachrichten*. (Vol 314, No. 4, 1993), 225-267. See page 139 for bibliographic details of all ten articles.

⁶ Tovmassian, H.M., Torres-Papaqui, J.P., Tiersch, H. Isolated Shakhbazian Compact Groups. *Астрофизика*, (Vol 53, No. 3, 2010), 353-362

- To further darken the field around you, use a hooded vest. The hood should block all extraneous light, including the sky glow and even the Milky Way at very dark sites.
- Use your eyepiece guards. They offer an extra light blocking barrier between your eyepiece and your eye. If your eyepiece doesn't come with one, you can install one for some eyepiece. See my website at faintfuzzies.com/ObservingAids.html for some ideas.
- If you think you saw the object(s), but are not sure, gently tap the telescope or wiggle it. The stars will wiggle in the eyepiece, and if you saw the object, it would wiggle as well along with the foreground stars.
- Sometimes if you are very tired you won't see as much. Take a nap or rest. Try to observe in a comfortable position. It helps if you aren't straining your neck (or anything else) when you are trying to observe. Some fleeting objects would disappear when fatigued.
- Use high magnification, such as 300x or even higher. When I observe objects from this list, I generally use my 6mm ZAO-II, 5mm BGO, and/or 4mm ZAO-II orthoscopic eyepieces in my 22". I employ the TMB 1.8x ED Barlow if I need even more magnification.
- Use low-glass count and high transmission eyepieces. Even with modern glass polish and coating technology, there is still a very small, but noticeable difference between high glass count eyepieces, such as the common wide-field eyepiece versus a simple Orthoscopic or Plössl. Over the years, I've done comparisons between various eyepieces, such as the Naglers, Ethos, Naglers, Pentax XW's, Orthoscopics (Zeiss, Baader, University Optics, etc.), and Plössl (some makes) and found that low-glass count eyepieces consistently outperform high-glass count eyepieces. See my website under Observing Tips, titled Going DEEP with simple eyepieces, for more information.

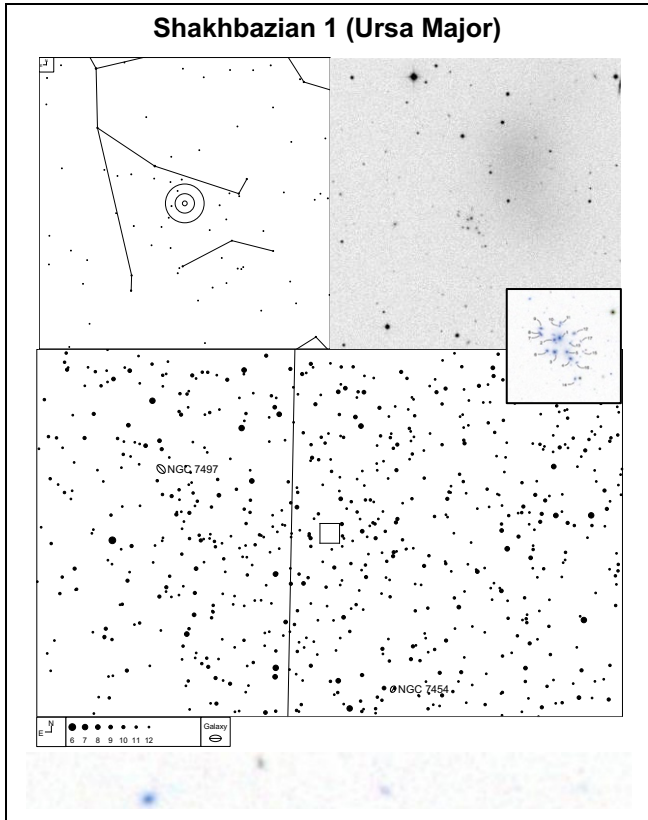

When you observe these Shakhbazian Compact Galaxy Groups, let others know and encourage them to take on this challenging observing project.

Post your observations at www.deepskyforum.com and I'm sure that other "extreme" deep sky observers would like to read them.

Any feedback or suggestions would be greatly appreciated. I strive to be as accurate as possible. Are there any other Shk groups you feel that should be included? Let me know.

I hope to keep this resource updated and made available to you, the deep sky observer.

How to Use the Atlas

The top left panel contains the naked eye field with the TelRad™ superimposed on the center of the Shakhbazian Compact Galaxy Group. The top right panel contains the inverted DSS image. The image is generally 10' square, otherwise larger.

The bottom panel is a finder field of about 4.8° across and 3.0° high. The finder field is wide enough for the finder scope and detailed enough for those who choose to use a low-power eyepiece as a “finder”. The limiting magnitude of the field stars is generally set to 12.0 but set to a lower limit in star-rich regions. A magnitude scale is provided on the bottom left. The field of the DSS image is superimposed on the finder chart. An inverted SDSS image, if available, is provided on the middle right.

The inset images are marked for member galaxies based on D. Stoll’s journal articles.

A table is provided at the bottom of each page listing the following basic information:

- **Object** – The listed catalog name of the brightest member(s), if one exists.
- **RA and Dec** – coordinates of approximate center of the group in Epoch 2000.0. I’ve corrected the RA and Dec from the original papers.
- **#** - the number of galaxies as listed in Stoll’s papers.
- **Mag** – magnitude of the brightest member. The magnitude figures with an * are from Stoll’s papers, otherwise from SDSS or NED. Sources: Stoll’s paper, SDSS, or NED.
- **Size** – the listed size of the group. Source Shakhbazian’s original papers and list from CDS.
- **Cmpt** - the ratio of the sum of the diameters of all the galaxies of the group to the diameter of the group. The higher the number, the “richer” the group. Source VizieR.

The Atlas is arranged starting with Pegasus and then working eastwards. The Shk groups are then grouped by constellation in RA order. I have arranged it this way, so it is easier to observe multiple Shk groups within an observing session. Just turn to the section where the constellation is high in the sky and go from there.

Revision History

Date	Revision
March, 2010	All – Grouped by Constellation starting with Pegasus moving eastwards Shk 1 – corrected coordinates and finder chart Shk 6 – corrected coordinates
March ,2012	Shk 6 – corrected coordinates and size based on NED data Shk 191 – refined coordinates based on NED data Shk 213 – refined coordinates Shk 219 – refined coordinates based on NED data Shk 360 – refined coordinates
March, 2013	Refresh
March, 2013	<ul style="list-style-type: none"> • Very minor enhancements <ul style="list-style-type: none"> ○ Enhanced TOC ○ Moved the index to the beginning ○ Enhanced recommended reading section
April, 2013	<ul style="list-style-type: none"> • Added front cover
April, 2024	<p>Major update</p> <ul style="list-style-type: none"> • Added additional groups (Shk 2, 4, 7, 8, 10, 17, 18, 20, 27, 31, 32, 39, 41, 43, 51, 55, 57, 67, 74, 82, 83, 95, 104, 105, 113, 119, 120, 123, 138, 131, 135, 181, 182, 186, 188, 212, 218, 220, 223, 244, 245, 253, 254, 257, 266, 278, 282, 285, 330, 344, 345, 346, 348, 350, 351, 355, 358, 359, 371, and 376). • Deleted Shk 21. • Added Intro section. • Added link to full Shakhbazian list. • Added Coefficient of Compactness (Cmpt) to give an idea how dense the group is. • Updated data throughout. <ul style="list-style-type: none"> ○ Corrected RA and Dec to the center of the group. Some of the RA/Dec in the original papers were not accurate. ○ Updated Mag using data from D. Stoll's, SDSS and/or NED. ○ Updated the number of members (#) with D. Stoll's figures. • Added SDSS inserts with marked members for most groups. • Major update to the bibliographic data.
